6-ARYL PYRIDO[2,3-d]PYRIMIDINES AND NAPHTHYRIDINES FOR  
INHIBITING PROTEIN TYROSINE KINASE  
MEDIATED CELLULAR PROLIFERATION

5

## FIELD OF THE INVENTION

This invention relates to inhibition of protein  
tyrosine kinase (PTK) mediated cellular proliferation.  
10 More specifically, this invention relates to the use of  
pyrido[2,3-d]pyrimidines and naphthyridine compounds in  
inhibiting cellular proliferation and protein tyrosine  
kinase enzymatic activity.

15

## BACKGROUND OF THE INVENTION

Many disease states are characterized by the  
uncontrolled proliferation and differentiation of  
20 cells. These disease states encompass a variety of  
cell types and maladies such as, cancer, athero-  
sclerosis, and restenosis. Growth factor stimulation,  
autophosphorylation, and the phosphorylation of  
intracellular protein substrates are important  
25 biological events in the pathomechanisms of  
proliferative diseases.

30

In normal cells, the phosphorylation of tyrosine  
residues on protein substrates serves a critical  
function in intracellular growth signaling pathways  
initiated by stimulated extracellular growth factor  
receptors. For example, the association of growth  
factors such as Platelet Derived Growth Factor (PDGF),  
Fibroblast Growth Factor (FGF), and Epidermal Growth  
Factor (EGF) with their respective extracellular  
receptors activates intracellular tyrosine kinase  
enzyme domains of these receptors, thereby catalyzing

-2-

the phosphorylation of either intracellular substrates or the receptors themselves. The phosphorylation of growth factor receptors in response to ligand binding is known as autophosphorylation.

5 For example, the EGF receptor has as its two most important ligands EGF and Transforming Growth Factor  $\alpha$ , (TGF $\alpha$ ). The receptors appear to have only minor functions in normal adult humans, but are implicated in the disease processes of a large portion of all  
10 cancers, especially colon and breast cancer. The closely related Erb-B2 and Erb-B3 receptors have a family of Heregulins as their major ligands, and receptor overexpression and mutation have been unequivocally demonstrated as the major risk factor in  
15 poor prognosis breast cancer.

The proliferation and directed migration of vascular smooth muscle cells (VSMC) are important components in such processes as vascular remodeling, restenosis and atherosclerosis. Platelet-derived  
20 growth factor has been identified as one of the most potent endogenous VSMC mitogens and chemoattractants. Elevated vascular mRNA expression of PDGF-A and -B chains and PDGF receptors has been observed in balloon-injured rat carotid arteries (J. Cell. Biol.,  
25 111:2149-2158 (1990)). In this injury model, infusion of PDGF also greatly increases intimal thickening and migration of VSMC (J. Clin. Invest., 89:507-511 (1992)). Furthermore, PDGF-neutralizing antibodies significantly reduce intimal thickening following  
30 balloon injury (Science, 253:1129-1132 (1991)).

Both acidic fibroblast growth factor (aFGF) and basic fibroblast growth factor (bFGF) have many biological activities, including the ability to promote cellular proliferation and differentiation. Tyrphostin  
35 receptor tyrosine kinase inhibitors which block the PDGF signal transduction pathway have been shown to

-3-

inhibit PDGF stimulated receptor tyrosine kinase phosphorylation in vivo in the rat model of balloon angioplasty (Drug Develop. Res., 29:158-166 (1993)). Direct evidence in support of FGF involvement in VSMC has been reported by Lindner and Reidy (Proc. Natl. Acad. Sci. USA, 88:3739-3743 (1991)), who demonstrated that the systemic injection of a neutralizing antibody against bFGF prior to balloon angioplasty of rat carotid arteries inhibited injury-induced medial SMC proliferation by greater than 80% when measured 2 days after injury. It is likely that bFGF released from damaged cells is acting in a paracrine manner to induce VSMC growth. Recently, Lindner and Reidy (Cir. Res., 73:589-595 (1993)) demonstrated an increased expression of both mRNA for bFGF and FGFR-1 in replicating VSMCs and endothelium in en face preparations of balloon-injured rat carotid arteries. The data provides evidence that in injured arteries the ligand/receptor system of bFGF and FGFR-1 may be involved in the continued proliferative response of VSMCs leading to neointima formation.

Thus, EGF, PDGF, FGF, and other growth factors play pivotal roles in the pathomechanisms of cellular proliferative diseases such as cancer, atherosclerosis, and restenosis. Upon association with their respective receptors, these growth factors stimulate tyrosine kinase activity as one of the initial biochemical events leading to DNA synthesis and cell division. It thereby follows that compounds which inhibit protein tyrosine kinases associated with intracellular growth factor signal transduction pathways are useful agents for the treatment of cellular proliferative diseases. We have now discovered that certain pyrido[2,3-d]-pyrimidines and naphthyridines inhibit protein tyrosine kinases, and are useful in treating and preventing atherosclerosis, restenosis, and cancer.

-4-

Several pyrido[2,3-d]pyrimidines and naphthyridines are known. For example, U.S. Patent Number 3,534,039 discloses a series of 2,7-diamino-6-arylpyrido[2,3-d]pyrimidine compounds as diuretic agents; U.S. Patent Number 3,639,401 discloses a series of 6-aryl-2,7-bis((trialkylsilyl)amino)pyrido[2,3-d]pyrimidine compounds as diuretic agents; U.S. Patent Number 4,271,164 discloses a series of 6-substituted-arylpyrido[2,3-d]pyrimidin-7-amines and derivatives as antihypertensive agents; European Published Application Number 0 537 463 A2 discloses a series of substituted-pyrido[2,3-d]pyrimidines useful as herbicides; U.S. Patent Number 4,771,054 discloses certain naphthyridines as antibiotics. None of the foregoing references teach the compounds of this invention or suggest such compounds are useful for treating atherosclerosis, restenosis, and cancer.

The free acid forms differ from their respective salt forms somewhat in certain physical properties such as solubility in polar solvents, but otherwise the salts are equivalent to their respective free acid for purposes of the present invention.

While the forms of the invention herein constitute presently preferred embodiments, many others are possible. It is not intended herein to mention all of the possible equivalent forms or ramifications of the invention. It is understood that the terms used herein are merely descriptive rather than limiting, and that various changes may be made without departing from the spirit or scope of the invention.

Compounds of Formula I may be prepared according to the syntheses outlined in Schemes I-VII. Although these schemes often indicate exact structures, the methods apply widely to analogous compounds of Formula I, given appropriate consideration to protection and deprotection of reactive functional groups by methods standard to the art of organic chemistry. For example, hydroxy groups, in order to prevent unwanted side reactions, generally need to be converted to ethers or esters during chemical reactions at other sites in the molecule. The hydroxy protecting group is readily removed to provide the free hydroxy group. Amino groups and carboxylic acid groups are similarly derivatized to protect them against unwanted side reactions. Typical protecting groups, and methods for attaching and cleaving them, are described fully by Greene and Wuts in Protective Groups in Organic Synthesis, John Wiley and Sons, New York, (2nd Ed, 1991), and McOmie, Protective Groups in Organic Chemistry, Plenum Press, New York, 1973.

Scheme I describes a typical method for the preparation of 1-tert-butyl-3-[7-(3-tert-butylureido)-

-19-

6-(aryl)-pyrido[2,3-d]pyrimidin-2-yl]ureas and 1-[2-Amino-6-(aryl)-pyrido[2,3-d]pyrimidin-7-yl]-3-tert-butylureas from the key intermediate 2,7-diamino-6-(aryl)-pyrido[2,3-d]pyrimidine, which can be prepared by the method of U.S. Patent Number 3,534,039.

5 Generally, the reaction can be accomplished by reacting 2,7-diamino-6-(aryl)-pyrido[2,3-d]pyrimidine compounds with one equivalent of an acylating agent, such as an alkyl isocyanate, isothiocyanate, carbamoyl chloride, carbamoyl bromide, sulfamoyl chloride, chloroformate, 10 or other activated acid derivatives such as symmetrical anhydrides, mixed anhydride, and the like. The reaction is carried out in neat isocyanate, or in the presence of a base, preferably sodium hydride in a suitable unreactive solvent such as dimethylformamide, dioxane, or the like. The starting material, a 15 2,7-diamino-6-(aryl)-pyrido[2,3-d]pyrimidine, can be reacted in the same manner as described above using a two-fold excess or greater of acylating reagent to give primarily the diacylated compounds, for example a 20 1-tert-butyl-3-[7-(3-tert-butylureido)-6-(aryl)-pyrido[2,3-d]pyrimidin-2-yl]urea.

The acylation generally is substantially complete when conducted for about 1 to 3 hours at a temperature of about 20° to about 80°C. The product is readily 25 isolated by normal methods, for instance by filtering any solids and removing the reaction solvent by evaporation. The product can be purified if desired by routine methods, for instance crystallization from 30 organic solvents such as ethyl acetate, dichloromethane, hexane, and the like, as well as chromatography over solid supports such as silica gel. The compounds of the invention typically are solids which are readily crystallized.

35 Scheme II illustrates a typical acylation of a 2,7-diamino-6-(aryl)-pyrido[2,3-d]pyrimidine using a

-20-

two-fold or larger excess of acetic anhydride with heating to prepare the diacylated product, for example an N-[2-acetylamino-6-(aryl)-pyrido[2,3-d]pyrimidin-7-yl]-acetamide. More generally, diacylated compounds of this type can be prepared by this method starting from the appropriate 2,7-diamino-6-(aryl)-pyrido[2,3-d]pyrimidine compounds and treating them with excess acylating reagents such as acid anhydrides, mixed acid anhydrides, or activated acyl derivatives such as acid chlorides and sulfonyl chlorides. The reaction is generally carried out at a temperature between about 20°C and 200°C. The addition of organic or inorganic bases such as triethylamine and sodium hydroxide may be desired to scavenger acid byproducts produced during the course of the reaction. The diacylated product is readily isolated and purified by chromatography or crystallization as described above.

Scheme III illustrates the preparation of a 6-(aryl)-N<sup>7</sup>-alkyl-pyrido[2,3-d]pyrimidine-2,7-diamine in several steps starting with a 2,7-diamino-6-(aryl)-pyrido[2,3-d]pyrimidine which can be prepared by the method of U.S. Patent Number 3,534,039. Treatment of the starting material with aqueous mineral acid under reflux conditions provides the hydrolysis product 2-amino-6-(aryl)-pyrido[2,3-d]pyrimidin-7-ol. Reaction of the 2-amino-6-(aryl)-pyrido[2,3-d]pyrimidin-7-ol with thionyl chloride under Vilsmeier-Haack conditions affords the chloro-formamidine product N'-(7-chloro-6-(aryl)-pyrido[2,3-d]pyrimidin-2-yl)-N,N-dimethyl-formamidine. This reactive intermediate can be directly reacted with nucleophilic reagents such as amines to give an N<sup>7</sup>-alkyl-6-(aryl)-pyrido[2,3-d]pyrimidine-2,7-diamine. Alternatively, the formamidine functionality can be removed by alcoholysis to provide the 7-chloro derivative, i.e., a 2-amino-7-chloro-6-(aryl)-pyrido[2,3-d]pyrimidine. Reaction of the

-21-

7-chloro intermediate with nucleophilic reagents such as an alkylamine provides the corresponding 6-(aryl)-N<sup>7</sup>-alkyl-pyrido[2,3-d]pyrimidine-2,7-diamine.

5 Scheme IV describes the preparation of a 3-(aryl)-[1,6]naphthyridine-2,7-diamine and represents a general methodology for the preparation of these compounds. The hydrogenolysis of 6-bromo-2,4-diamino-5-cyanopyridine (JACS, 80:2838-2840 (1958)) affords the  
10 intermediate 2,4-diamino-5-cyanopyridine. The subsequent hydrogenation of the cyanopyridine compound, for example, in a mixture of formic acid-water employing Raney nickel catalyst, provides a key versatile intermediate 2,4-diamino-5-pyridine-carboxaldehyde. The aldehyde is then condensed with an  
15 aryl acetonitrile as described in Scheme IV to provide a 3-(aryl)-[1,6]naphthyridine-2,7-diamine. The condensation reaction is accomplished in the presence of an alkoxide base, for example, sodium ethoxide or sodium 2-ethoxyethoxide, which can be generated in situ  
20 by the addition of sodium metal or sodium hydride to ethanol or 2-ethoxyethanol. Scheme IV describes a general methodology for the preparation of the 3-(aryl)-[1,6]naphthyridine-2,7-diamines of this invention.

25 Scheme V illustrates the direct dialkylation of a 6-aryl-pyrido[2,3-d]pyrimidine-2,7-diamine (U.S. Patent Number 3,534,039) with an alkylamine in a bomb at high temperature to afford an N<sup>2</sup>,N<sup>7</sup>-dialkyl-6-aryl-pyrido[2,3-d]pyrimidine-2,7-diamine. Generally, this  
30 reaction is carried out using neat amine reagents such as isobutylamine and n-hexylamine, at a temperature such as 150-300°C in a bomb apparatus.

35 Scheme VI illustrates the synthesis of compounds of Formula I wherein R<sub>1</sub> can be an aminoalkyl group such as diethylaminopropyl. A 6-(aryl)-2,7-diamino-pyrido[2,3-d]pyrimidine can be reacted directly with an

-22-

amine nucleophile such as an aminoalkylamine (e.g.,  $H_2N$  alkyl- $NR_5R_6$ ), generally in a bomb and in the presence of an acid such as sulfamic acid, to afford an aminoalkyl substituted compound of the invention. The compound can be further acylated, if desired, by routine methods. The compounds are readily isolated and purified by common methodologies such as crystallization and chromatography.

Scheme VII illustrates the synthesis of compounds of Formula I wherein  $R_3$  and  $R_4$  are taken together with the nitrogen to which they are attached to form a cyclic ring. The ring can include another heteroatom such as nitrogen, oxygen, or sulfur. In Scheme VII, a diaminopyridopyrimidine is reacted with a halo ethyl isocyanate to produce an imidazolidinone. The reaction generally is carried out in an organic solvent such as dimethylformamide, and normally in the presence of a base such as sodium hydride. The reaction typically is complete in about 8 to 16 hours when carried out at about  $30^\circ C$ . The product is readily isolated and purified by routine methods.

The above reaction also produces compounds of Formula I wherein  $R_1$  or  $R_3$  is an acyl analog of the

Scheme VIIa illustrates the reaction. The product can be isolated by routine methods such as chromatography, fractional crystallization, and the like.

Another group of compounds provided by the invention are amidines, compounds of Formula I wherein  $R_1$  and  $R_2$  together with the nitrogen to which they are

-24-

example at the 2-position, is reacted with an aryl amine (e.g.,  $\text{Ar}'\text{NH}_2$ ), to effect displacement of the thio- sulfoxide or sulfone substituent, to produce the corresponding N-aryl amino pyridopyrimidine. The displacement reaction generally is carried out in an organic solvent such as dimethylformamide, normally at a temperature of about  $20^\circ\text{C}$  to about  $80^\circ\text{C}$ . The reaction generally is complete after about 3 to about 8 hours, and the product is readily isolated by adding the reaction mixture to water and extracting the product into a solvent such as methylene chloride, or the like.

Scheme X illustrates the synthesis of N-aryl amino pyridopyrimidines starting from a suitably substituted pyrimidine, e.g., 4-amino-2-chloropyrimidine-5-carbonitrile. The halo group is displaced by reaction with an aryl amine ( $\text{Ar}'\text{NH}_2$ ) to give the corresponding 2-N-aryl aminopyrimidine, having a cyano group at the 5-position. The cyano group is converted to an aldehyde by reduction with Raney nickel in water and formic acid, and the resulting 2-arylamino-4-amino-pyrimidine-5-carboxaldehyde is reacted with an aryl acetonitrile (e.g., phenylacetonitrile, 2-pyridyl-acetonitrile, or the like) in the manner described in Scheme IV to provide the corresponding N-aryl-amino-pyridopyrimidine of the invention.

-23-

attached, and  $R_3$  and  $R_4$  together with the nitrogen to which they are attached, can be a group having the

5                   (H,  $\text{CH}_3$ , or  $\text{NH}_2$ )  
                  |  
formula  $-\text{N}=\text{C}-\text{R}_8$ .

Scheme VIII illustrates the synthesis of typical pyridopyrimidine amidines which can be produced by reacting an amino pyridopyrimidine with an acetal of an  
10       amide or cyclic amide, for example, the dimethyl acetal of N,N-dimethylformamide, or the dimethylacetal of N-methylpyrrolidone. The reaction typically is carried out by mixing an amino pyridopyrimidine with about an  
15       equimolar quantity or excess of an acetal in a mutual solvent such as dimethylformamide, dimethylsulfoxide, tetrahydrofuran, or the like. The reaction generally is complete with about 3 to 6 hours when carried out at a temperature of about  $5^\circ\text{C}$  to about  $50^\circ\text{C}$ . The product is readily isolated by routine procedures and can be  
20       purified, if desired, by normal techniques such as chromatography, crystallization, and the like.

The invention also provides amino pyrido-  
pyrimidines wherein the amino group is substituted with  
an aryl  $\text{Ar}'$ , for example a phenyl, substituted phenyl,  
25       pyridyl, thiazolyl, pyrimidyl, and the like. Preferred N-aryl compounds have the formula

where  $\text{Ar}$ ,  $\text{Ar}'$ , and  $\text{B}$  are as defined above. Such  
compounds can be prepared by any of several methods,  
35       for example, as described in Schemes IX and X.

In Scheme IX, a pyridopyrimidine substituted with  
an alkylthio, alkyl sulfoxide or alkyl sulfone, for

The compounds of Formula I are valuable inhibitors of protein tyrosine kinases and possess therapeutic value as cellular antiproliferative agents for the treatment of proliferative disorders. These compounds are potent inhibitors of one or more of the protein kinases, PDGF, FGF, EGF, V-src, and C-src. The invention compounds are thus useful in treating atherosclerosis, restenosis, and cancer. Specific tumors to be treated with the compounds include small-cell lung carcinoma such as that described in An. Rev. Respir. Dis., 142:554-556 (1990); human breast cancer as described in Cancer Research, 52:4773-4778 (1992); low grade human bladder carcinomas of the type described in Cancer Research, 52:1457-1462 (1992); human colorectal cancer as discussed in J. Clin. Invest., 91:53-60 (1993); and in J. Surg. Res., 54:293-294 (1993). The compounds also are useful as antibiotics against bacteria such as *Streptococcus pneumoniae*. For instance, the compounds of Examples 9 and 18 exhibited activity against this Gram + bacterial strain when evaluated in standard in vitro assays. The compounds additionally are useful as herbicides against a wide variety of undesirable plants such as broad leaf weeds and grasses.

The compounds of the present invention can be formulated and administered in a wide variety of oral and parenteral dosage forms, including transdermal and rectal administration. It will be recognized to those skilled in the art that the following dosage forms may comprise as the active component, either a compound of Formula I or a corresponding pharmaceutically acceptable salt or solvate of a compound of Formula I.

A further embodiment of this invention is a pharmaceutical formulation comprising a compound of Formula I together with a pharmaceutically acceptable carrier, diluent, or excipient therefor. For preparing

-37-

pharmaceutical compositions with the compounds of the present invention, pharmaceutically acceptable carriers can be either solid or liquid. Solid form preparations include powders, tablets, pills, capsules, cachets, 5 suppositories, and dispersible granules. A solid carrier can be one or more substances which may also act as diluents, flavoring agents, binders, preservatives, tablet disintegrating agents, or an encapsulating material.

10 In powders, the carrier is a finely divided solid such as talc or starch which is in a mixture with the finely divided active component.

In tablets, the active component is mixed with the carrier having the necessary binding properties in 15 suitable proportions and compacted in the shape and size desired.

The formulations of this invention preferably contain from about 5% to about 70% of the active compound. Suitable carriers include magnesium 20 carbonate, magnesium stearate, talc, sugar, lactose, pectin, dextrin, starch, gelatin, tragacanth, methylcellulose, sodium carboxymethylcellulose, a low melting wax, cocoa butter, and the like. A preferred form for oral use are capsules, which include the 25 formulation of the active compound with encapsulating material as a carrier providing a capsule in which the active component with or without other carriers, is surrounded by a carrier, which is thus in association with it. Similarly, cachets and lozenges are included. 30 Tablets, powders, capsules, pills, cachets, and lozenges can be used as solid dosage forms suitable for oral administration.

For preparing suppositories, a low melting wax, such as a mixture of fatty acid glycerides or cocoa 35 butter, is first melted and the active component is dispersed homogeneously therein, as by stirring. The

-38-

molten homogenous mixture is then poured into convenient sized molds, allowed to cool, and thereby to solidify.

5 Liquid form preparations include solutions, suspensions, and emulsions, for example, water or water-propylene glycol solutions. For parenteral injection, liquid preparations can be formulated in solution in aqueous polyethylene glycol solution, isotonic saline, 5% aqueous glucose, and the like.

10 Aqueous solutions suitable for oral use can be prepared by dissolving the active component in water and adding suitable colorants, flavors, stabilizing and thickening agents as desired.

15 Aqueous suspensions suitable for oral use can be made by dispersing the finely divided active component in water with a viscous material, such as natural or synthetic gums, resins, methylcellulose, sodium carboxymethylcellulose, and other well-known suspending agents.

20 Also included are solid form preparations which are intended to be converted, shortly before use, to liquid form preparations for oral administration. Such liquid forms include solutions, suspensions, and emulsions. These preparations may contain, in addition to the active component, colorants, flavors, stabilizers, buffers, artificial and natural  
25 sweeteners, dispersants, thickeners, solubilizing agents, and the like. Waxes, polymers, and the like can be utilized to prepare sustained-release dosage forms. Also, osmotic pumps can be employed to deliver  
30 the active compound uniformly over a prolonged period.

35 The pharmaceutical preparations of the invention are preferably in unit dosage form. In such form, the preparation is subdivided into unit doses containing appropriate quantities of the active component. The

-39-

unit dosage form can be a packaged preparation, the package containing discrete quantities of preparation, such as packeted tablets, capsules, and powders in vials or ampoules. Also, the unit dosage form can be a capsules, tablet, cachet, or lozenge itself, or it can be the appropriate number of any of these in packaged form.

The therapeutically effective dose of a compound of Formula I will generally be from about 1 mg to about 100 mg/kg of body weight per day. Typical adult doses will be about 50 to about 800 mg per day. The quantity of active component in a unit dose preparation may be varied or adjusted from about 0.1 mg to about 500 mg, preferably about 0.5 mg to 100 mg according to the particular application and the potency of the active component. The composition can, if desired, also contain other compatible therapeutic agents. A subject in need of treatment with a compound of Formula I will be administered a dosage of about 1 to about 500 mg per day, either singly or in multiple doses over a 24-hour period.

The compounds of this invention have been evaluated in standard assays which are utilized to determine inhibition of tyrosine kinase. One such assay was conducted as follows:

#### **Purification of Epidermal Growth Factor Receptor Tyrosine Kinase**

75 mM phosphoric acid and passed through a 2.5-cm  
phosphocellulose filter disc to bind the peptide. The  
30 filter was washed five times with 75 mM phosphoric acid  
and placed in a vial along with 5 mL of scintillation

#### PDGF and FGF Receptor Tyrosine Kinase Assays

35 Full length cDNAs for the mouse PDGF-β and human  
FGF-1 (flg) receptor tyrosine kinases were obtained

-41-

from J. Escobedo and prepared as described in J. Biol. Chem., 262:1482-1487 (1991), and PCR primers were designed to amplify a fragment of DNA that codes for the intracellular tyrosine kinase domain. The fragment was melded into a baculovirus vector, cotransfected with AcMNPV DNA, and the recombinant virus isolated. SF9 insect cells were infected with the virus to overexpress the protein, and the cell lysate was used for the assay. The assay was performed in 96-well plates (100  $\mu$ L/incubation/well), and conditions were optimized to measure the incorporation of  $^{32}$ P from  $\gamma$ - $^{32}$ P-ATP into a glutamate-tyrosine co-polymer substrate. Briefly, to each well was added 82.5  $\mu$ L of incubation buffer containing 25 mM Hepes (pH 7.0), 150 mM NaCl, 0.1% Triton X-100, 0.2 mM PMSF, 0.2 mM  $\text{Na}_3\text{VO}_4$ , 10 mM  $\text{MnCl}_2$ , and 750  $\mu$ g/mL of Poly (4:1) glutamate-tyrosine followed by 2.5  $\mu$ L of inhibitor and 5  $\mu$ L of enzyme lysate (7.5  $\mu$ g/ $\mu$ L FGF-TK or 6.0  $\mu$ g/ $\mu$ L PDGF-TK) to initiate the reaction. Following a 10 minute incubation at 25°C, 10  $\mu$ L of  $\gamma$ - $^{32}$ P-ATP (0.4  $\mu$ Ci plus 50  $\mu$ M ATP) was added to each well and samples were incubated for an additional 10 minutes at 25°C. The reaction was terminated by the addition of 100  $\mu$ L of 30% trichloroacetic acid (TCA) containing 20 mM sodium pyrophosphate and precipitation of material onto glass fiber filter mats (Wallac). Filters were washed three times with 15% TCA containing 100 mM sodium pyrophosphate and the radioactivity retained on the filters counted in a Wallac 1250 Betaplate reader. Nonspecific activity was defined as radioactivity retained on the filters following incubation of samples with buffer alone (no enzyme). Specific enzymatic activity was defined as total activity (enzyme plus buffer) minus nonspecific activity. The concentration of a compound that

-42-

inhibited specific activity by 50% ( $IC_{50}$ ) was determined based on the inhibition curve.

#### V-src and C-src Kinase Assays

5 V-src or C-src kinase is purified from baculovirus infected insect cell lysates using an antipeptide monoclonal antibody directed against the N-terminal 2-17 amino acids. The antibody, covalently linked to 0.65- $\mu$ m latex beads, is added to a suspension of insect  
10 cell lysis buffer comprised of 150 mM NaCl, 50 mM Tris pH 7.5, 1 mM DTT, 1% NP-40, 2 mM EGTA, 1 mM sodium vanadate, 1 mM PMSF, 1  $\mu$ g/mL each of leupeptin, pepstatin, and aprotinin. Insect cell lysate containing either the c-src or v-src protein is  
15 incubated with these beads for 3-4 hours at 4°C with rotation. At the end of the lysate incubation, the beads are rinsed 3 times in lysis buffer, resuspended in lysis buffer containing 10% glycerol, and frozen. These latex beads are thawed, rinsed three times in  
20 assay buffer which is comprised of 40 mM tris pH 7.5, 5 mM  $MgCl_2$ , and suspended in the same buffer. In a Millipore 96-well plate with a 0.65  $\mu$ m polyvinylidene membrane bottom are added the reaction components: 10- $\mu$ L v-src or c-src beads, 10  $\mu$ L of 2.5 mg/mL poly  
25 GluTyr substrate, 5  $\mu$ M ATP containing 0.2  $\mu$ Ci labeled  $^{32}P$ -ATP, 5 $\mu$ L DMSO containing inhibitors or as a solvent control, and buffer to make the final volume 125  $\mu$ L. The reaction is started at room temperature by addition of the ATP and quenched 10 minutes later by the  
30 addition of 125  $\mu$ L of 30% TCA, 0.1 M sodium pyrophosphate for 5 minutes on ice. The plate is then filtered and the wells washed with two 250- $\mu$ L aliquots of 15% TCA, 0.1 M pyrophosphate. The filters are punched, counted in a liquid scintillation counter, and  
35 the data examined for inhibitory activity in comparison to a known inhibitor such as erbstatin. The method is

-43-

described more fully in J. Med. Chem., 37:598-609 (1994).

### Cell Culture

5        Rat aorta smooth muscle cells (RASMC) were isolated from the thoracic aorta of rats and explanted according to the method of Ross, J. Cell. Biol., 30:172-186 (1971). Cells were grown in Dulbecco's modified Eagle's medium (DMEM, Gibco) containing 10% fetal calf serum (FBS, Hyclone, Logan, Utah), 1% glutamine (Gibco) and 1% penicillin/streptomycin (Gibco). Cells were identified as smooth muscle cells by their "hill and valley" growth pattern and by fluorescent staining with a monoclonal antibody specific for SMC  $\mu$ -actin (Sigma). RASMC were used between passages 5 and 20 for all experiments. Test compounds were prepared in dimethylsulfoxide (DMSO) in order to achieve consistency in the vehicle and to ensure compound solubility. Appropriate DMSO controls were simultaneously evaluated with the test compounds.

### [<sup>3</sup>H]-Thymidine Incorporation Assay

RASMC were plated into a 24-well plate (30,000 cells/well) in DMEM with 10% FBS. After 4 days, cells reached confluence and were made quiescent by incubation in DMEM/F12 medium (Gibco) containing 0.2% FBS for another 2 days. DNA synthesis was induced by incubating cells for 22 hours with either PDGF-BB, bFGF, or FBS, plus test compound in 0.5 mL/well serum-substituted medium (DMEM/F12 + 1% CPSR-2 from Sigma). After 18 hours, 0.25  $\mu$ Ci/well [<sup>3</sup>H]-thymidine was added. Four hours later, the incubation was stopped by removing the radioactive media, washing the cells twice with 1 mL cold phosphate-buffered saline, and then washing 2 times with cold 5% trichloroacetic acid. The acid-insoluble

-44-

fraction was lysed in 0.75 mL 0.25 N NaOH and the radioactivity determined by liquid scintillation counting. IC<sub>50</sub> values were determined graphically.

#### 5 PDGF Receptor Autophosphorylation

RASMC were grown to confluency in 100 mm dishes. Growth medium was removed and replaced with serum-free medium and cells were incubated at 37°C for an additional 24 hours. Test compounds were then added directly to the medium and cells incubated for an additional 2 hours. After 2 hours, PDGF-BB was added at a final concentration of 30 ng/mL for 5 minutes at 37°C to stimulate autophosphorylation of the PDGF receptor. Following growth factor treatment, the medium was removed, and cells were washed with cold phosphate-buffered saline and immediately lysed with 1 mL of lysis buffer (50 mM HEPES[pH 7.5], 150 mM NaCl, 10% glycerol, 1% Triton X-100, 1 mM EDTA, 1 mM EGTA, 50 mM NaF, 1 mM sodium orthovanadate, 30 mM p-nitrophenyl phosphate, 10 mM sodium pyrophosphate, 1 mM phenylmethyl sulfonyl fluoride, 10 µg/mL aprotinin, and 10 µg/mL leupeptin). Lysates were centrifuged at 10,000 × g for 10 minutes. Supernatants were incubated with 10 µL of rabbit anti-human PDGF type AB receptor antibody (1:1000) for 2 hours. Following the incubation, protein-A-sepharose beads were added for 2 hours with continuous mixing, and immune complexes bound to the beads washed 4 times with 1 mL lysis wash buffer. Immune complexes were solubilized in 30 µL of Laemmli sample buffer and electrophoresed in 4-20% SDS polyacrylamide gels. Following electrophoresis, separated proteins were transferred to nitrocellulose and immunoblotted with anti-phosphotyrosine antiserum. Following incubation with [<sup>125</sup>I]-protein-A, the levels of tyrosine phosphorylated proteins were detected by phosphorimage

-45-

analysis and protein bands quantitated via densitometry.  $IC_{50}$  values were generated from the densitometric data.

The invention compounds are especially useful for treating restenosis following balloon angioplasty of

-49-

occluded arteries. Restenosis occurs in about 40% of individuals undergoing angioplasty of calcified arteries and is a major problem associated with this form of treatment of patients suffering from such cardiac condition. The invention compounds demonstrate good activity when evaluated in standard tests such as described below.

#### Balloon Angioplasty of Rat Carotid Arteries

Male Sprague-Dawley rats (350-450 g) are divided into two treatment groups: one group of rats (n = 10) are treated with drug (100 mg/kg PO, BID) and the second group received vehicle (2 mL/kg PO, BID (n = 10)). All animals were pretreated for 2 days prior to surgery and continued to receive daily drug treatment postinjury until sacrificed.

Balloon injury in rat carotid arteries were performed according to the following protocol. Rats were anesthetized with Telazol (0.1 mL/100 g IM), and the carotid artery exposed via an anterior mid-line incision on the neck. The carotid artery was isolated at the bifurcation of the internal and external carotid arteries. A 2F embolectomy catheter was inserted in the external carotid artery and advanced down the common carotid to the level of the aortic arch. The balloon was inflated and the catheter is dragged back to the point of entry and then deflated. This procedure is repeated two more times. The embolectomy catheter was then removed and the external carotid artery was ligated leaving flow intact through the internal carotid artery. Surgical incisions were closed, and the animal was allowed to recover from anesthesia before being returned to its home cage.

At various time points postinjury animals were euthanized with CO<sub>2</sub> inhalation, and the carotid artery was perfusion fixed and processed for histologic

-50-

examination. Morphologic determination of lesion size was made by measuring the area of the carotid artery intima expressed as a ratio of the media in individual animals. Up to 16 sections were prepared from each animal to give a uniform representation of lesion size down the length of the carotid artery. The cross-sectional areas of the blood vessels were quantified using an image analysis program from Princeton Gamma Tech (Princeton, New Jersey).

The following examples illustrate methods for preparing intermediate and final products of the invention. They are not intended to limit the scope of the invention. Mixtures of solvents are volume/volume.

## Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:  
Although claims 54-70 are directed to a method of treatment of (diagnostic method practised on) the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2. ☐ Claims Nos.:  
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
